# Easy Email Scrambler

[DOWNLOAD HERE](#)

Sadly, there are a number of spambots which roam the web harvesting email addresses to send spam to. Often, you have no choice but to include a mailto link with an email address in a web page. Fortunately most of these spambots do not seem to have complete HTML parsers, and most do not execute JavaScript. Easy Email Scrambler uses obfuscation to generate a mailto: link which will confuse nave spambots, but will still work in standard browsers. If you own, or operate even 1 website, you know how inundated you can get with spam. What This Amazing Software Does: This software will take your existing email address and scramble it up a bit making it obscure to most spam bots, thereby eliminating much of the spam you probably receive on a daily basis. If nothing else, this simple little software application will save you loads of time by not having to constantly check/delete useless spam messages.
