

Numerical Modeling In Open Channel Hydraulics

[DOWNLOAD HERE](#)

Preface- 1. Open channel flow equations- 1.1. Basic definitions- 1.2. General equations for incompressible liquid flow- 1.3. Derivation of 1 D dynamic equation- 1.4. Derivation of 1- D continuity equation- 1.5. System of equations for unsteady gradually varied flow in open channel- 1.6. Steady gradually varied flow in open channel - 1.7. Storage equation- 1.8. Equation of mass transport- 1.9. Thermal energy transport equation- 1.10. Types of equations applied in open channel hydraulics- 2. Methods for solving algebraic equations and their systems- 2.1. Solution of non-linear algebraic equations - 2.2. Solution of systems of the linear algebraic equations - 2.3. Solution of non-linear system of equations- 3. Numerical solution of ordinary differential equations- 3.1. Initial- value problem- 3.2. Initial value problem for a system of ordinary differential equations- 3.3. Boundary value problem- 4. Steady gradually varied flow in open channels- 4.1. Introduction- 4.2. Numerical solution of the initial value problem for steady gradually varied flow equation in a single channel- 4.3. Solution of the boundary problem for steady gradually varied flow equation in single channel- 4.4. Steady gradually varied flow in open channel networks- 5. Partial differential equations of hyperbolic and parabolic type- 5.1. Types of partial differential equations and their properties - 5.2. Introduction to the finite difference method - 5.3. Introduction to the finite element method- 5.4. Properties of the numerical methods for partial differential equations- 6. Numerical solution of the advection equation- 6.1. Solution by the finite difference method- 6.2. Amplitude and phase errors- 6.3. Accuracy analysis using the modified equation approach- 6.4. Solution of the advection equation with the finite element method- 6.5. Numerical solution of the advection equation with the method of characteristics- 7. Numerical solution of the advection- diffusion equation- 7.1. Problem presentation- 7.2. Solution by the finite difference method- 7.3. Solution using the finite element method- 7.4. Solution of the advection- diffusion equation with splitting technique- 7.5. Solution of the advection- diffusion equation using the splitting technique and the convolution integral- 8. Numerical integration of the system of Saint Venant equations- 8.1. Introduction- 8.2. Solution of the Saint Venant equations using the Preissmann scheme- 8.3. Solution of the Saint Venant equations using the modified finite element method- 8.4. Some aspects of application of the Saint Venant equation - 8.5. Unsteady flow

in the case of movable channel bed- 8.6. Application of the Saint Venant equations for the steep waves-
9. Simplified equations of the unsteady flow in open channel- 9.1. Simplified forms of the Saint Venant
equations- 9.2. Simplified flood routing models in the form of transport equations- 9.3. Mass and
momentum conservation in the simplified flood routing models in the form of transport equations - 9.4.
Lumped flood routing models- 9.5. Convolution integral in open channel hydraulics- Index EAN/ISBN :
9789048136742 Publisher(s): Springer Netherlands Format: ePub/PDF
