

Trends In Computational Nanomechanics

[DOWNLOAD HERE](#)

1. Introduction: Computational Nanomechanics.- 2. New Theoretical Concepts: Objective Molecular Dynamics.- Properties of Carbon Nanotubes Derived from Symmetry-Adapted Schemes.- Nanocrystalline Nanowires: Structure, Electrons, and Phonons.- 3. Advanced Quantum Chemistry Approaches: Density Functional Theory for Nanosystems.- Quantum Monte Carlo.- Methods for Non-Born-Oppenheimer Processes 1.- Methods for Non-Born-Oppenheimer Processes 2.- Quantum Mechanics for the Electronic Wavefunctions of Large Molecules and Crystals.- 4. Multiscale Methods and Applications: Large Scale Molecular Dynamics Modeling.- Multiscale Hybrid Simulation Methods for Materials.- Overview of Quasicontinuum Method.- Orbital-Free Density-Functional Theory.- Accelerated Molecular Dynamics Methods.- Kinetic Monte Carlo.- Transition Path Theory.- Advances in Transition State Computations.- Development of Methodologies for Global Structural Optimization of 1-and 2-D nanostructures.- Predicting New Materials by Electronic Structure Methods.- Multiscale Simulations of Carbon Nanotubes.- Atomistic-Based Continuum Theories for Carbon Nanotubes.- Ab Initio Pressure Methods. EAN/ISBN : 9781402097850 Publisher(s): Springer Netherlands Format: ePub/PDF Author(s): Dumitrica, Traian
