Instant Video Streamer

[DOWNLOAD HERE](#)

Instant Video Streamer is a desktop application that offers you the ability to create streaming videos online even if you have big files (such as long video recordings). Ever tried to put a video file (e.g. flash) on the internet and it took for ever to load because it was too big? Ever visited a web site that just says Loading forever before the flash file starts? Instant Video Streamer is a windows desktop application that converts video files (.avi, mpeg, etc) to flash video files (.flv), then creates the files necessary to stream them. It works more or less like the Instant Video Creator, except everything happens on your computer. The result is several files, and a HTML file embedded with code to stream the files. All you need to do is just upload all the files and paste the HTML code to your web site to add streaming video to your web site. - Why is it so HOT? - Streaming video on web sites is HOT because its effect is comparable to none if done properly. Instructional videos, demos, marketing messages can all greatly boost your sales to the roof and reduce refunds and support issues more than any marketing words. Anybody who sells ANY products or services online can greatly benefit from this software. The market for it is just blazing RED HOT!
