# Frontiers Of Fundamental Physics

Introduction. Part I: Field Theory, Relativity and Cosmology. Cosmological Theories of Special and General. Cosmological Theories of Special and General Relativity. Carmeli s Cosmology: the Universe is Spatially Flat Without Dark Matter. Black Holes and the Information Paradox. A Quantum Approach to Cosmology. My Focus on the Quantum Source of Gravity. Vacuum Decay by p-branes Production. Super-strong Interacting Gravitons as a Main Engine of the Universe Without Expansion or Dark Energy. Generalized Cosmological Constraints on Neutrino Oscillations Relaxed or Strengthened. Attractions of Affine Quantum Gravity. Gravitational Tunnelling of Relativistic Shells. Three-dimensional Relativistic Simulations of Rotating Neutron-star Collapse to a Kerr Black Hole. Gravitational Wave Sources. Model Analysis of Gravitational Shell Collapses. The Deuteron and the Big Bang. Astrophysical Applications of the Theory of Scale Relativity. Making Maps of the Rees-Sciama Effect. Stationary Points of Scalar Fields Coupled to Gravity. The Density Matrix Deformation in Quantum and Statistical Mechanics of the Early Universe. Part II: Foundations of Physics. Dark Energy, Chaotic Fields, and Fundamental Constants. How Fundamental is Gravitation. Scale-dependent Stochastic Quantization. Principia Geometrica Physicae. Do Real Numbers Obscure Real Physics. Cantorian Space in Nature and Dynamical Systems. Mathematical Structure of Individual Quantum States. Space and Time Physics with the Lorentz Ether: the Clock Paradox. Part III: Nuclear and High-Energy Particle Physics and Astrophysics. Clusters of Matter and Antimatter - a Mechanism for Cold Compression. Understanding the Nucleon Spin. The Mass and Spin of the Mesons, Baryons, and Leptons. Equality and Identity and (In)distinguishability in Classical and Quantum Mechanics from the Point of View of Newton s Notion of State. Numerical Modelling of Quantum Statistics in High-energy Physics. Frontiers of High Energy Cosmic Rays. Outlooks on Gamma Ray Astrophysics. Will Antihydrogen Light Shine? Physics Potential of the ATLAS Experiment. A Global Optimization Algorithm for Finite Density Quark Matter. Multiphoton Approach on Pair Production under the Light of Recent Experimental and Theoretical Investigations. Nielsen Identity, Wilson Line and Constrained Effective Action: the High Temperature Standard Model. The MAGIC Experiment and its First Results. Neural Networks for Gamma-hadron Separation in MAGIC. Gamma-Ray Astrophysics with

AGILE. Simulating the High Energy Gamma-ray Sky Seen by the GLAST Large Area Telescope. Dark Matter Detection in Gamma Astroparticle Experiments. Contribution of Pulsars to the Gamma-ray Background and Their Observation with the Space Telescopes GLAST and AGILE. Data Mining in Gamma Astrophysics Experiments. Grid services for the MAGIC experiment. Part IV: Complex Systems. Towards a Physical Model for Memory. Patterns and Dissipative Waves, including Solitons, in Lattices and at Interfaces. Lattice Protein Models: A Computational Approach to Folding and Aggregation Phenomena. Interface Depinning from Wedges with a Central Ridge. Part V: New Approaches to Physics Teaching. Learning Problems Related to the Concept of Field. Elastic Waves: Mental Models and Teaching/Learning Sequences. Index of Authors. EAN/ISBN : 9781402043390 Publisher(s): Springer Netherlands Format: ePub/PDF Author(s): Sidharth, B. G. - Honsell, F. - Angelis, A. de
