Explains how to support a patient's breathing in emergencies and how to administer emergency anaesthesia. There are few situations more challenging and stressful than airway compromise in acutely ill patients. This book describes the principles of emergency airway management outside the operating theatre, systematically leading the reader through the components of successful practice from the principles of oxygen delivery and patient assessment to rapid sequence induction of anaesthesia, tracheal intubation and the difficult and failed emergency airway. Supported by clear diagrams and algorithms, the text includes sections on a range of special circumstances and up-to-date considerations of non-invasive ventilatory support, post-intubation management and commonly used drugs. Compiled by an expert team of physicians from emergency medicine, anaesthesia and critical care, Emergency Airway Management is an invaluable resource for trainee doctors in all acute specialties who may be called upon to manage a patient's airway in an emergency situation. It is also the official course manual of the UK Training in Emergency Airway Management (TEAM) course.
