"The 16 scientific contributions in the book center around the topics of systematics, benthic algal ecology, and environmental assessment. A cornerstone idea in Professor Lowe s research efforts is that ecology and systematics are closely intertwined and ecological research is impossible without a sound systematical background. It will be very useful to researchers interested in algal ecology in general and those working in alga-based water quality analysis." (K. . Szab, Acta Botanica Hungarica, Vol. 49, 2007)
