

## Watchman Pro - With

[DOWNLOAD HERE](#)

Monitor Your Websites 24/7 To Know Instantly When Your Sites Are Down Also Monitor Any Web Pages On Any Websites To Be Notified Of Updates One of the big drawbacks of running your own web business is your reliance on web hosting technology. Statistics show that the average web host is down for over two and a half hours each month, but for some hosts it is much worse than this. If you web host is down, your whole business is completely shut down. Potential customers arriving at your site will simply click away to your competitors. Existing customers and users may be frustrated and go elsewhere. Worst of

all, expensive advertising and pay-per-click costs will be wasted. Although most web hosting companies monitor their servers regularly, they do so at the server level, not through accessing the hosted websites. There are many faults that do not show up at the server level, which means that websites can be down for considerable periods without anyone even knowing about it. This problem has led to many site monitoring services being set up, which continually check websites and tell the owner (usually by email) if the site goes down. This allows the website owner to contact his or her hosting company to get the site restored as soon as possible. The drawback with these services is that they generally involve paying a monthly fee. Even \$10 a month can soon mount up, especially if you're just starting out. Accessing this type of online service also generally lacks the convenience and ease of use offered by a Windows software tool. Now there's a quick and easy alternative, which runs on your own PC, continually monitoring all your websites automatically. Quick And Easy Website Monitoring From Your Own PC Watchman Pro is a very easy to use Windows software tool. Simply download Watchman Pro, run it (no installation needed) and enter all the web addresses you want to monitor. Watchman Pro will hide itself in your system tray (the area at the bottom right of your screen where the clock appears). Whenever you are connected to the Internet, the software will silently probe each of your websites every 10 minutes (or at any other interval selected by you). If a problem is detected, a popup box will immediately appear notifying you of the problem, and (optionally) a siren sound will be emitted.
