"This is a most interesting and valuable book for the interdisciplinary community working collaboratively on space weather topics, both on research and applications, in Europe. All in all, this is a very useful compilation of the present state of knowledge on the science and applications of space weather. It is a fine resource for those entering the field or those already active in it. It should be on the shelves of all libraries which cover geophysics, in the widest sense of that word" (M. J. Rycroft, Surveys in Geophysics, Vol. 28, 2007) EAN/ISBN : 9781402054464 Publisher(s): Springer Netherlands Format: ePub/PDF
