Stochastic Analysis With Financial Applications

DOWNLOAD HERE

Part I: Stochastic Analysis.- Dirichlet forms for Poisson measures and Levy processes: the lent particle method.- Backward stochastic difference equations with finite states.- On a forward-backward stochastic system associated to the Burgers equation.- Quantifying model uncertainties in complex systems.- On the estimate for commutators in DiPerna-Lions theory.- Approximation theorem for stochastic differential equations driven by G-Brownian motion.- Stochastic flows for nonlinear SPDEs driven by linear multiplicative space-time white noises.- Optimal stopping problem associated with jump-diffusion processes.- A review of recent results on approximation of solutions of stochastic differential equations.-Strong consistency of Bayesian estimator under discrete observations and unknown transition density.-Stability of a nonlinear equation related to a spatially-inhomogeneous branching process. - Exponentially stable stationary solutions for delay stochastic evolution equations.- Robust stochastic control and equivalent martingale measures. - Multivalued stochastic differential questions driven by point processes. Logarithmic derivatives of densities for jump processes. - Part II: Financial Applications. - Convertible bonds in a defaultable diffusion model. - A geometric approach to option pricing with transaction costs in discrete models.- Completeness and hedging in a Levy bond market.- Asymptotically efficient discrete hedging.- Estimating joint default probability by efficient importance sampling with applications from bottom up.- Market models of forward CDS spreads.- Optimal threshold dividend strategies under the compound Poisson model with regime switching. EAN/ISBN : 9783034800976 Publisher(s): Springer, Berlin, Springer, Basel Format: ePub/PDF Author(s): Kohatsu-Higa, Arturo - Privault, Nicolas - Sheu, Shuenn-Jyi
