

# Hybrid Methods Of Molecular Modeling

[DOWNLOAD HERE](#)

Preface- 1. Molecular modeling: Problem formulation and wrapping contexts- 1.1 Motivation and General Setting- 1.2 Molecular Potential Energy: Quantum Mechanical Problem- 1.3 Basics of the Quantum Mechanical Technique- 1.4 Alternative Representations of Quantum Mechanics- 1.5 Basics of Quantum Chemistry- 1.6 Alternative Tools for Representing Electronic Structure- 1.7 General Scheme for Separating Electronic Variables- 2. Models of molecular structure: Hybrid perspective- 2.1 Ab Initio Methods- 2.2 Pseudopotential Methods and Valence Approximation- 2.3 Hartree-Fock-Roothaan Based Semiempirical Methods- 2.4 Non-Hartree-Fock Semiempirical Quantum Chemistry- 2.5 Classical Models of Molecular Structure: Molecular Mechanics- 2.6 Hybrid Methods of Modeling Complex Molecular Systems- 3. Deductive molecular mechanics: Bridging quantum and classical models of molecular structure- 3.1 Motivation. Molecular Mechanics and Additive Schemes. Stereochemistry and VSEPR Theory- 3.2 Characteristic Features of Molecular Electronic Structure in SLG Approximation - 3.3 Deductive Molecular Mechanics: Family of Approximations- 3.4 What is DMM?- 3.5 TATO-DMM and Intersubsystem Frontier- 3.6 Conclusion- 4. Synthesis: Hybrid molecular models for coordination compounds- 4.1 Characteristic Features of the Electronic Structure of Coordination Compounds- 4.2 Hybrid and Classical Models of Coordination Compounds of Nontransition Metals- 4.3 Qualitative Picture of Bonding in Metal Complexes- 4.4 Hybrid Model for Coordination Compounds- 4.5 Mechanistic Model for Stereochemistry of Complexes of Nontransition Elements- 4.6 Incorporating d-Metals into Molecular Mechanics. Models of Spin-Active Compounds- Conclusion. Remaining problems EAN/ISBN : 9781402081897 Publisher(s): Springer Netherlands Format: ePub/PDF Author(s): Lipscomb, W. N. - Chauvin, Yves
