

Chapter 09, Climatic Variability On Decadal To Century Timescales - Ann Henderson-sellers

[DOWNLOAD HERE](#)

This chapter reviews observations and models of decadal to centennial variability. Emphasis has been put on the dynamics of such fluctuations and the mechanisms that could potentially underlie decadal to centennial variability. Both internal and external mechanisms can produce significant decadal to centennial variability in climate models. This makes it difficult to anticipate which modes will be excited by external forcing such as a further gradual increase of atmospheric greenhouse gas concentrations during this century, because some of the excited modes may be strongly damped under present-day conditions. One should also keep in mind that the solar and volcanic influences have a competing effect on the Atlantic Meridional Overturning Circulation (AMOC). While increased solar radiation would force global warming and tend to slow the AMOC with reduced warming or even cooling in the North Atlantic, global cooling in response to enhanced volcanic activity would tend to spin up the Atlantic overturning circulation and lead to a relative warming in the North Atlantic. On the other hand, changes in atmospheric circulation patterns like the North Atlantic Oscillation, forced by external drivers, could also exert an influence on the AMOC. The net effect on the AMOC is, thus, hard to estimate if one does not consider the complete coupled system, including potential feedbacks from vegetation and atmospheric chemistry.
